

Applied Landscape Rehydration

Field days in five locations across the CQ region in 2013

Learn how to apply Natural Sequence Farming techniques as developed at Tarwyn Park to your own landscape in the Fitzroy Basin.*

Despite experiencing record rainfall events, are you finding that soil moisture is surprisingly limited?

Has flooding and intense rainfall caused major erosion to the broader landscape and watercourses on your property?

Then come and kick the dirt with other local landholders and discuss the problems and innovative solutions regarding erosion caused by excessive run-off in your own region.

Learn how to utilize more of this run-off water to the benefit of your business and the environment.

Come for one or all five days, and get the specific answers you are looking for on how to rehydrate the landscape, reduce erosion and capture nutrients to really make the most of both wet and dry years.
